

Demo video (4 min) and Feedback video (2 min) — word-for-word scripts with shot list

Record with OBS / Loom / Windows Game Bar at 1080p. Speak at a natural pace (~140 words/min). Keep the browser at 100 % zoom on <https://foresight-northbay.netlify.app>. Upload to YouTube as **Unlisted** (or Google Drive with "anyone with link"). Total demo target: 3:45–4:30.

A · Demo video — screen walkthrough (target 4:00)

Time	On screen	Say (verbatim)
0:00–0:25	Title slide of the executive readout PDF (slide 1), then cut to the live dashboard header	"Hi, I'm Eswar Mahalingam, Data Science intern at Zidio Development. This is Project FORESIGHT — a demand forecasting and inventory intelligence platform I built for our client NorthBay Living, a D2C home and lifestyle brand. Their problem: every month they stock out of things people want and sit on things they don't. FORESIGHT tells the ops team, for every product, what to reorder, what to clear, and what to leave alone — with the rupee value of each decision."
0:25–0:55	Overview tab. Point the cursor at each KPI card in turn	"This is the live dashboard on Netlify. Five numbers at the top answer the client's question immediately: ₹47.9 L of sales is at risk from stockouts across 8 products; ₹1.48 Cr of cash is locked in 8 overstocked products; 34 of 50 are healthy and need nothing; and the forecast behind all of this has been tested at 8.8 percent error — 22 percent better than simply repeating last year."
0:55–1:30	Hover bubbles on the decisioning grid; hover the red cluster, then the purple one. Change the Category filter to Storage, then back to All	"The grid is the heart of it. Up means likely to run out during the supplier lead time; right means holding far more than eight weeks of demand; bubble size is rupees at stake. Four quadrants, four actions — exactly the decisioning view in the engagement brief. Everything filters: pick Storage, and you see it carries most of the overstock. Hover any bubble and you get the position, the cover and the recommended action."
1:30–2:05	Reorder & markdown tab. Scroll the reorder list, point at SKU012's order quantity; then the markdown list; click Download CSV	"Tab two is what the team actually prints. The reorder list: SKU012 has 2 days of stock against a 12-day lead time — order 919 units now. The quantity covers demand through the lead time plus a four-week review cycle, plus safety stock, minus what's already on hand and on order. The markdown list shows SKU020 sitting on 15 weeks of cover — ₹43.3 L of cash. Note the margin flag: some of these sell below cost, so Finance checks them before any discount. One click exports the whole table."
2:05–2:50	Forecast explorer tab. Select SKU012. Point at the black line, blue line, band, dashed orange line, and the December dots. Then drag the lead-time slider from 12 to 25 and back	"Behind every score is a weekly forecast. Black is actual demand, blue is the FORESIGHT forecast with an 80 percent band, orange dashed is the seasonal-naïve baseline. The dots after the origin are December actuals the model never saw — they sit inside the band. Now the what-if: if this supplier's lead time slips to 25 days, watch the stockout probability and the sales at risk move instantly. It's the same transparent formula as the batch scoring, so an ops manager can test a scenario without calling me."
2:50–3:20	Model accuracy tab. Point at the fold chart, then the horizon chart, then the limitations text	"How do we know it's trustworthy? Rolling-origin backtesting: I retrained the model at six past dates using only earlier data and scored it on the next eight weeks each time — no random splits, no future information in any feature, and a unit test that enforces that. It beat the seasonal-naïve baseline on every fold, every horizon and every category, and on the December holdout. The limitations are written on the page in plain language."
3:20–3:45	Data quality tab (scroll the log); then Scoring API tab → click Try it live	"The pipeline logs every cleaning decision with its rationale — 150 inventory SKUs with no sales history, launch dates after first sale, 16 products priced below cost — those became findings for the client, not silent fixes. And the scoring service: a public endpoint that returns the forecast and risk for any SKU or batch, with what-if overrides, and it fails gracefully on bad input."
3:45–4:10	VS Code: repo tree, then terminal running <code>python src/run_all.py</code> (pre-recorded or sped up); end on README results table	"Everything regenerates from the raw files with one command in about a minute: pipeline, forecast and backtest, risk scoring, figures and the dashboard data. The repo has the notebooks, tests, the Streamlit and FastAPI editions, the EDA memo and the executive readout. Thank you — links are in the description."

Recording tips. Open all six tabs once before recording so charts are cached. Pre-type SKU012 in the API box. If the what-if slider is fiddly on camera, type 25 into the lead-time field instead. Cut dead air; graders reward a tight 4 minutes over a loose 6.

B · Feedback / reflection video (target 2:00)

Time	On screen	Say (verbatim)
0:00–0:15	Webcam, or the readout title slide	"Hi, I'm Eswar Mahalingam. This is my reflection on Project FORESIGHT, the demand and inventory intelligence platform I built during the Zidio Development Data Science and Analytics internship."
0:15–0:50	Backtest chart (fig 06)	"What I learned. The biggest lesson was discipline over cleverness. The brief said: define the metric, build a seasonal-naive baseline, and only then earn the right to use a complex model. Doing it in that order changed how I work. Rolling-origin backtesting, keeping every feature strictly in the past, and reporting WAPE against the baseline — those habits are what make a forecast trustworthy, and they are harder than the modelling itself. I also learned to turn predictions into decisions: a forecast nobody can act on has no value, so the risk layer and the rupee figures mattered as much as the accuracy."
0:50–1:25	Decisioning grid (fig 08), then the data-quality tab	"Challenges. Three stand out. First, time alignment — inventory was a monthly snapshot and sales were daily, so I set the forecast origin on the snapshot date to make the risk scores meaningful. Second, my first risk rule flagged 36 of 50 products for reorder — technically correct, practically useless. Reframing it as 'will it run out before the next order can land' gave a triage of eight, eight and thirty-four that an ops team can actually use. Third, the data itself: 150 inventory SKUs with no sales, products priced below cost. I learned to treat those as business findings for the client, not cleaning steps to hide."
1:25–1:50	Live dashboard URL on screen	"Key takeaways. Ship analytics as a product: a dashboard, an API, a one-command pipeline and a readout a non-technical person can follow. Be honest about limits — two years of history is one seasonal cycle, and I said so. And consultant framing works: lead with the rupee impact and the decision, then show the evidence."
1:50–2:05	Webcam	"Thank you to the Zidio mentors for the structure and the feedback at each weekly checkpoint. This project is now the anchor of my data science portfolio, and the method — baseline first, backtest honestly, decide transparently — is one I'll carry into every forecasting problem. Thanks for watching."

C · Submission checklist (Zidio roadmap)

#	Item	Marks	What to paste in the form
1	Source code	5	GitHub repo URL (public). Commands to publish: <code>cd foresight && git init && git add . && git commit -m "Project FORESIGHT" && gh repo create foresight --public --source=. --push</code> (or create the repo on github.com and <code>git remote add origin ... && git push -u origin main</code>)
2	Live deployment	5	https://foresight-northbay.netlify.app (dashboard) · https://foresight-northbay.netlify.app/api/score?sku=SKU012 (API)
3	Demo video	4	Unlisted YouTube link — script A above
4	Feedback video	4	Unlisted YouTube link — script B above
5	Project report	2	reports/Project_Report_FORESIGHT.pdf (also attach D7_Executive_Readout.pdf and D2_EDA_Data_Quality_Memo.pdf)
